

INDIAN INSTITUTE OF TECHNOLOGY ROPAR Department of Computer Science & Engineering E103Introduct: Computer Science & Data Structure GE103Introduction to Computing & Data Structures

Mide to Computing & Data Structures

MidTerm Exam 05Oct 2018 Max. Marks: 40

Name:

Time Limit: 120 minutes

Roll No:

NOTE:

 Read the questions carefully, and write your answers as neatly as possible.
 You need to write your answers in a low each question. You need to write your answers in the space provided below each question. No extra sheet should be attached to this paper. Rough ...

be attached to this paper. Rough work may be done in the space provided or in last empty sheet.

Best wishes!

[2 marks] Consider a two dimensional array: A[6][8] of total 48 integer elements. If the base address (A) is 1600 and the system of the memory address of address (A) is 1600 and the system uses zero-indexing, what is the memory address of element A[3][4]? Assume: element A[3][4] ? Assume:

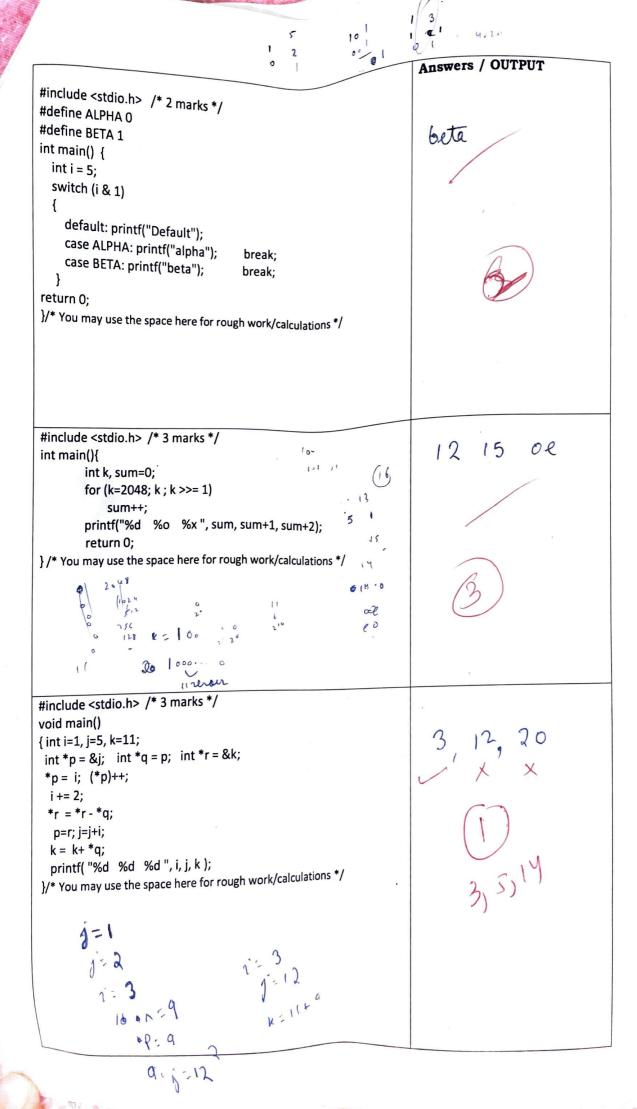

(a) Row-major order

(b) Column-major order

[18 marks] What will be the output for the following codes. Explanation for the output not necessary.

Answers / OUTPUT #include <stdio.h> /* 2 marks */ int main() { float f1; int i=40, j=30, k=20; int p=5; f1=42/4 + 4.0/3 + 5.24; p = i > j > k;printf("f1= %.2f p=%d", f1,p); }/* You may use the space here for rough work/calculations */ 10+1.33+5.24

```
Answers / OUTPUT
#include<stdio.h> /* 2.5 marks */
                                                                              of+2=V
Sized(an)=61yte
Sized(P)=46yte
void main() {
                                        //First element is L lower case
   char arr[] = {'l', 'a', 't', 'e', 's', 't'};
   char *p = (arr+2);
   printf("%c", *p+2);
   printf("\n %d %d", sizeof(arr), sizeof(p));
}/* You may use the space here for rough work/calculations */
 #include <stdio.h> /* 2.5 marks */
  void main()
  for (int k=1; k< 4; )
     printf( "%d \n", ++k );
  }/* You may use the space here for rough work/calculations */
  # include <stdio.h> /* 3 marks */
  int main() {
    int i = 0;
    for (i=1; i<20; i++) {
     switch(i) {
      case 1:
       i += 1;
       case 2:
       i += 3;
       case 4:
       i += 4;
       default:
       i += 8;
        break;
     printf(" %d ", i);
    return 0;
   }/* You may use the space here for rough work/calculations */
```

3. [2 marks] A student wrote following that the code is wrong. Student approached the elements. But on execution, it is observed small mistake(s) in this code. Spot the mistake(s) (Encircle that line(s)) & mention what should be the correct statement/expression(s) there.

```
void reverse(int A[], int n) {
  int i, j, temp;
  i=0;
  while (i < n) {
      j= n-1-i;
      temp = A[i];
      A[i] = A[j];
      A[j] = temp;
      i++;
    }</pre>
```

[3 marks] Refer to following partial C code to transpose a square matrix (or say 2D array).
 Complete the code (.... part) without using any additional array and without declaring any additional variable.
 #include <stdio.h>

```
printf("\n Following is the TRANSPOSE matrix \n");
for (i=0;i<N;i++) { printf("\n");
    for (j=0;j<N;j++)
        printf("%d ", (A[i][j]) );
}</pre>
```

}

value n (assume input n will be positive and less than 100).
Will this program give the desired output? If not, Identify and Remove the errors (Mark / Encircle the wrong statements (if any) and write there correct statements.)

#include <stdio.h>
void main() {
 int n, factor, k;
 printf("\n Enter the number for which you need to print multiplication table \n");
 scanf("%d", n);
 printf("\n Multiplication table is as follows \n");
 while (factor<=10) {
 k=n * factor;
 printf("%d X %02d = %d", n, factor, k);
 }
 rue guen brogram will not give the desired outflood with free
 can ("' / d", b yt.")

 factor t

11:3=0

5. [5 marks] Given an input string inp. complete the C program below that does the following marks] Given an input string inp, complete characters that appear twice or more in the

It first computes the total number input string) and also changes the input string.

Then it removes all digits (if any in the input string as output at it.

input string.

Then it removes all digits (if any in the modified input string as output string alphabets to lowercase. Then it prints this modified input string as output string. Then it removes all digits (if any prints tries h181SharmAaa", the output string.

As an example, if input string inp is "Animesh181SharmAaa", the output would be

No. of characters that repeat

Output String: animeshsharmaaa

Output String: animeshsharmaaa

Output String: animeshsharmaaa

Output String: animeshsharmaaa

/*Ans above 5 because A, m, h, 1, and a are the characters that appear again */ /* you are not permitted to use any other library functions */
#define \$7 1000 #define SZ 1000 void main() { int i,j,k,temp1,temp2; char c1, c2, c3; 11 & 4 None on leyth of the string for (2=0; iel; i++) { count 1=0

for (1=0; iel; i++) {

y (sri]==scj])

count 1++; 30 4 (count 1 >= 2) count 2++; built ("No of chareatin that repeat is it d", count?)

(it of it of ; a <= 19

(it o); it of ; a

(Note: You may safely assume that size of the input string is less than 1000. You may write the code within the main function to achieve the input or you may write a separate function e.g. int fun1(char *arr) and call that function appropriately within main function to achieve the purpose)

for (1=0; 1<1; 1+1) {

Jon (y=2; y<2i, j+1) {

y (sci) = 7=! A! Ll sci) <= 12!

y (sci) = 5ci) + 'a'-'A'

if (sci) >= '0! LL sci] <= 19!

if (sci) >= '0! LL sci] <= 19!

scj = skilj

for (j=i; j <= i, j+1) {

Scj = skjl |

scj = skjl |

[7 marks] Consider a singly linked list (based on NODE structure as mentioned below) referred using the global node pointer variable head. Write the C code for successfully deleting the (first appearing) node having data value key. If there is no node in the linked list that has data value key, the code brings no change to the linked list. If there are multiple nodes with data value key, the code deletes that one which appears first while traversing the linked list using global pointer variable head. typedef struct node{ int data: struct node * next; } NODE: Function prototype is as follows - void find_delete(int key); Hinclude < staio 4> typedef struct node (int data; Ctrust node " west; 3 NODE: HEAR, NODE " HEAD = NULL; interior void main () { built ("anter me alund no on of to insert on element or delete an element in). Scanf (""d", An) Switch (n) { Case 1: Insert (key)

Case 1: find-delete (inst key) Void I ment (if they) { NODE" temp = (NODE") malloc (Size of (NODE)); temp - data = key
temp - next = MEAD MEAD = temp;

while (temps next 1= NVLL)
