

## INDIAN INSTITUTE OF TECHNOLOGY ROPAR Department of Computer Science & Engineering GE103Introduction to Computing & Data Structures MidTerm Exam 050ct 2018

Max. Marks: 40

Name:

Time Limit: 120 minutes

Roll No:

## NOTE:

- Read the questions carefully, and write your answers as neatly as possible.

  You need to write your answers as neatly as possible. You need to write your answers in the space provided below each question. No extra sheet should be attached to this part. be attached to this paper. Rough work may be done in the space provided or in last empty sheet.

  Best wishes I
- Best wishes!
- [2 marks] Consider a two dimensional array: A[6][8] of total 48 integer elements. If the base address (A) is 1600 address (A) is 1600 and the system uses zero-indexing, what is the memory address of element A[3][4] 2 Appears a two dimensional array: A[6][8] of total 40 integral and the system uses zero-indexing, what is the memory address of element A[3][4] ? Assume:
  - (a) Row-major order

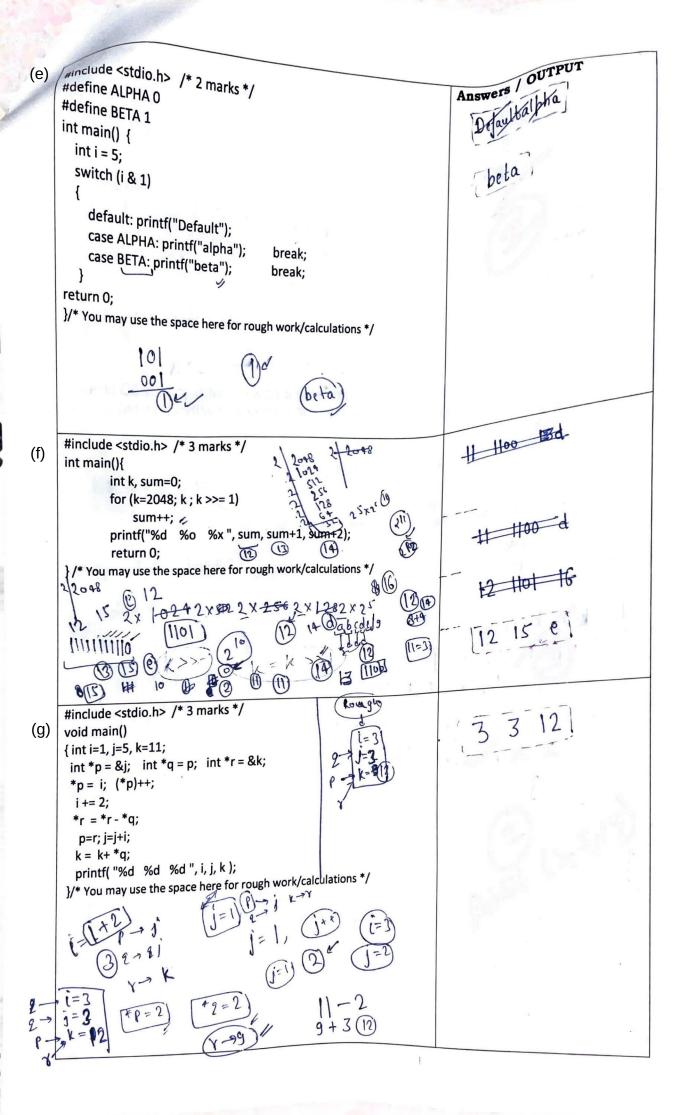

(b) Column-major order

$$1600 + (4 \times 6) \times 4 + 34 \times 4$$
  
=  $1600 + 96 + 12$ 

2. [18 marks] What will be the output for the following codes. Explanation for the output not necessary.

Answers / OUTPUT #include <stdio.h> /\* 2 marks \*/ (a) | int main() { float f1; int i=40, j=30, k=20; int p=5; f1=42/4+4.0/3+5.24;p = i > j > k;printf( "f1= %.2f p=%d", f1,p); }/\* You may use the space here for rough work/calculations \*/

```
3. [2 marks] A student wrote following code for reversing an input integer array A of n
             [2 marks] A student tion, it is observed that the code is wrong. Student approached the elements. But on execution what a mention what a ment
              elements. But on executing that there is/are small mistake(s) in this code. Spot the mistake(s) TA Raman who replied mention what should be the correct statement/expression(s).
              TA Raman who replied mention what should be the correct statement/expression(s) there.
                             void reverse(int A[], int n) {
                                    int i, j, temp;
                                                                                                                                                                      while (i 4 (n/2)) {
                                    j=0;
                                    while (i < n) {
                                                 j= n-1-i;
                                                 temp = A[i];
                                                  A[i] = A[j];
                                                  A[ j ] = temp;
                                                  i++;
                                                }
                   Refer to following partial C code to transpose a square matrix (or say 2D array).

[3 marks] Refer to following part) without using any additional
                  [3 marks] Refer to tollowing Figure 10 transpose a square matrix (or say 2D array). Complete the code ( .... part) without using any additional array and without declaring any
                   additional variable.
                         #include <stdio.h>

                                             }
```

}

```
marks] Consider the following C code that aims to print the multiplication table of input I this program give the positive and local to the errors (Mark /
5(a) Jaiue n (assume input n will be positive and less than 100).
     Will this program give the desired output? If not, Identify and Remove the errors (Mark / Encircle the wrong statements (if any) and write the
     Encircle the wrong statements (if any) and write there correct statements.)
        #include <stdio.h>
        void main() {
            int n,factor,k;
            printf("\n Enter the number for which you need to print multiplication table \n");

printf("\d (", n));
            printf("\n Multiplication table is as follows \n");
            factor=1;
            while (factor<=10) {
              k=n * factor; ربيب
              printf("%d X %02d = %d", n, factor, k);
            }
         No this program will not give derived output;
         # include < stdio.h>
          void a main () { .
      int n, Jactor, K;
                                                    · ");
              print (" - - -
                scan (" % d " , & n);
               print(" - - - ");
                 Jactor = 1;
                 while (factor <= 10) {
                          K = n * Jactor;
                        print ( ( ", d X %, 02d = %d M", n, lactor, k); Jactor ++;
```

- 5(b)[5 marks] Given an input string inp, complete the C program below that does the following [5 marks] Given an interpret total number of those characters that appear twice or more in the
  - input string.

    Then it removes all digits (if any in the input string) and also changes the input string.

    Then it removes all digits (if any in the input string) and also changes the input string.
    - Then it removes all the input string and also changes the input alphabets to lowercase. Then it prints this modified input string as output string. alphabets to lowercast string inp is 'Animeshing' and also changes the input string as output string.

      As an example, if input string that repeat 5

      No. of characters animeshsharmass

No. of characters animeshsharmaaa

Output String: all Min, h, 1, and a are the characters that appear again \*/

```
#include<stdio.h>
/* you are not permitted to use any other library functions */
#define SZ 1000
int i,j,k,temp1,temp2; char c1, c2, c3;
void main() {
char inp[SZ]; scanf("%s", inp);
11 .... k=0; templ=0;
   Jor (i=0; i \ SZ; i++)
      { jor (j=03i+1; j \( \) \( \) \( \) \( \)
             { | (inpliate rimp(f)) | CI = inp[i]; (2 = inp[j];
     ij(C1== (2) { k++; }
          il (K==2) {templ++; }
         K = 0;
    print ("No. of characters that repeat = %d \n", templ);
     Jor( 1=0; (252; i++)
           C1 = inp[i];
              if (c1>64 && c1291)
                 { c1=c1+32;
                   inp[i] = (1;
         else il (C1 > 96 && C1 < 123)
                     c1 = "; inpti] = C1; ]
          92/9
```

(Note: You may safely assume that size of the input string is less than 1000. You may write the code within the main function to achieve the purpose or you may write a separate the purpose) fun1(char \*arr) and call that function appropriately within main function to achieve the purpose)

Print ("Output String: 1/25/n", inp);

6. [7 marks] Consider a singly linked list (based on NODE structure as mentioned below) referred using the global node pointer variable head. Write the C code for successfully deleting the (first appearing) node having data value key. If there is no node in the linked list that has data value key, the code brings no change to the linked list. If there are multiple nodes with data value key, the code deletes that one which appears first while traversing the linked list using global pointer variable head.

int data; struct node \* next;

NODE;

Function prototype is as follows - void find\_delete( int key );

void sind\_delete (int key) {

if ( head == NULL)

{ prints (" There are nodes not available ");
}

else { if (head --> data == key)

{ head = node \* next;
}

Jor (int i=0; i < to size of (NOOE); i++)

{
if (node \* next-> data) == key)

{
 node \* previous == node \* next;
}
