

## INDIAN INSTITUTE OF TECHNOLOGY ROPAR Department of Computer Science & Engineering GE103Introduction to Computing & Data Structures MidTerm Exam 050ct 2018

Max. Marks: 40

Time Limit: 120 minutes

Name:

Roll No:

## NOTE:

Read the questions carefully, and write your answers as neatly as possible.

| The content of the content

You need to write your answers in the space provided below each question. No extra sheet should be attached to this paper. Rough work me be attached to this paper. Rough work may be done in the space provided or in last empty sheet.

1. [2 marks] Consider a two dimensional array: A[6][8] of total 48 integer elements. If the base address (A) is 1600 and the system uses zero-indexing, what is the memory address of

(a) Row-major order

0123456

Memory address of A[3][4]

Answers / OUTPUT

(b) Column-major order

01234567 8

2. [18 marks] What will be the output for the following codes. Explanation for the output not necessary.

#include <stdio.h> /\* 2 marks \*/ int main() { f1=6.57 P=5 float f1; int i=40, j=30, k=20; int p=5; f1=42/4+4.0/3+5.24; p = i > j > k;20 printf( "f1= %.2f p=%d", f1,p); }/\* You may use the space here for rough work/calculations \*/

```

3. [2 marks] A student wrote following code that the code is wrong an input integer array A of n elements. But on execution, it is observed small mistake(s) in this code. Spot the mistake(s) TA Raman who replied that there is/are should be the correct statement/expression(s) there.

}
4. [3 marks] Refer to following partial *C* code to transpose a square matrix (or say 2D array).

Complete the code ( .... part) without using any additional array and without declaring any

```
#include <stdio.h>
#define N 12 /* this value 12 may vary by program user*/
void main() {
    int A[N][N]; int i,j,k,temp1,temp2;
    printf("\n Input the NxN matrix elements where N= %d . \n", N);
    for (i=0;i<N;i++) {
        for (j=0;j<N;j++)
            scanf("%d ",&(A[i][j]) );
}
```

for (j=0; j2N; j++)

{

for (i=0; i2N; i++)

Printf("%d", A[i](i]);

4

```
printf("\n Following is the TRANSPOSE matrix \n");
for (i=0;i<N;i++) { printf("\n");
    for (j=0;j<N;j++)
        printf("%d ", (A[i][j]) );
}</pre>
```

}

or statements (if any) and write the multiplication table of input the world the statements.)

```
#include <stdio.h>

void main() {

int n,factor,k;

printf("\n Enter the number for which you need to print multiplication table \n");

scanf("%d ", n);

printf("\n Multiplication table is as follows \n");

while (factor<=10) {

k=n * factor;

printf("%d X %Q2d = %d", n, factor, k); factor ++;

}
```

5(b)[5 marks] Given an input string inp, complete those marks] Given an input string inp, control of those characters that appear twice or more in the input string) and at the input string and in the input string.

marks] Given the total number of the input string and also changes the input string input string. Then it removes all digits (if any in this modified input string as output string as output string as output string as output string.

It first composed in the intermediate (if any in the input string) and also changes the input string.

Then it removes all digits (if any in this modified input string as output string as output string.

Then it removes all digits (if any in the input string as output string.)

Then it removes all digits (if any in the input string in prints this modified input string as output string.)

Then it removes all digits (if any in the input string as output string.)

Then it removes all digits (if any in the input string as output string.) Then it removes all digits (" Animesh181SharmAaa", the output would be as an example, if input string input s

No. of characters that repeat = 5 No. of characters that appear again \*/

Output String: animeshsharmaaa

Output String: animeshsharmaaa

Ishrary functions \*/

```
/* you are not permitted to use any other library functions */
#define SZ 1000
int i,j,k,temp1,temp2; char c1, c2, c3;
void main() {
char inp[SZ]; scanf("%s", inp);
 for (9=0, 9252,9++)
// ....
  inp (i) = inp (i+1);
  引井;
  Printf("No. of characters that repeat = o/d", inp(1));
   4
 -for (j=0) j252)j++)
   inp [] = inp (z'-)+ ; // first z is capital, second z is small.
  temp1 = Porp [i];
     inp(i) = inp(z'-j+ 21);
   temp1 = Pnp ['z' -j+ 'z'];
    temp 2 = inp(k);
    temp1 = temp1;
     it+;
printf (" Output string: 0/6c", temp2);
```

(Note: You may safely assume that code within the main function to achieve the input string is less than 1000. You may write the fun1(char \*arr) and call that function to achieve the purpose or you may write a separate function to achieve the purpose of the input string is less than 1000. You may write the function e.g. int function achieve the purpose or you may write a separate function to achieve the purpose of the input string is less than 1000. You may write the fun1(char \*arr) and call that function to achieve the purpose of your may write the function e.g. int

6. [7 marks] Consider a singly linked list (based on NODE structure as mentioned below) referred using the global node pointer variable head. Write the C code for successfully deleting the (first appearing) node having no change to the linked list that has data value key, the code deletes that one which appears first while traversing the linked list using global pointer variable head.

typedef struct node{ int data; struct node \* next;

} NODE;
Function prototype is as follows - void find\_delete( int key );
